Airport Design Challenge

In order to educate and inspire students (K-12) to better understand airports and their leading role in the National Airspace System, the FAA is hosting another run of the acclaimed Airport Design Challenge competition which utilizes Microsoft's Minecraft to assist in developing a model airport with all of the required airside elements. Individually or in small teams, participants will receive instruction from FAA staff who specialize in specific areas of the airport each week. With that information, students will research a local airport of their choosing and then recreate that airport in the virtual world of Minecraft!
